TOOTH - Root post - Zirconium oxide ceramics - SpeedCEM Plus

| SpeedCEM Plus The self-adhesive, self-curing resin cement with light-curing option                             | Manufacture to the second seco |
|--|--|
| OptraDam Anatomically shaped rubber dam for the absolute isolation of the working field                        | CONTRACT THE CONTR |
| Total Etch Total Etch is an etching gel containing 37% phosphoric acid   |  |
| Monobond Plus  Monobond Plus is the universal primer for the conditioning of all types of restoration surfaces | Renobond Plat  |
| ExciTE F is a light-curing, fluoride releasing, single-component total-etch adhesive                           |  |
| MultiCore Core build-up in vital and non-vital teeth   | proceedings to the second seco |

## Flowchart SpeedCEM Plus

TOOTH - Root post - Zirconium oxide ceramics - SpeedCEM Plus

Preoperative situation

Relative isolation of the treatment field - preferrably with **OptraDam** or alternatively with absorbent pads and a saliva ejector - is indispensible.

The root post is tried in

The root post is tried in. If prefabricated posts are used, the excess length is determined and the post is shortened extraorally by means of rotating diamond grinding instruments.

The root post is pretreated

After try-in, the post is cleaned with alcohol or conditioned as directed by the manufacturer.

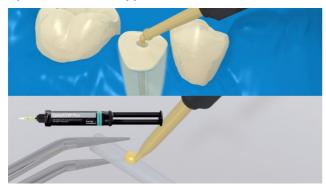

The conditioned root canal is disinfected

Finally, the conditioned root canal is disinfected and dried with paper points.

SpeedCEM Plus is applied

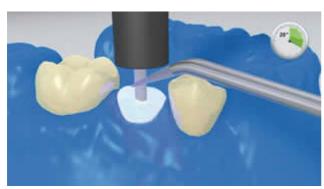

The root post prepared according to the instructions of the manufacturer is coated with mixed **SpeedCEM Plus**. Furthermore, SpeedCEM Plus can be placed directly in the root canal using Intra Canal Tips.

The root post is seated

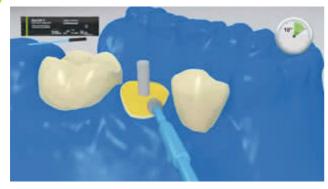

The root posts are placed and excess is removed.

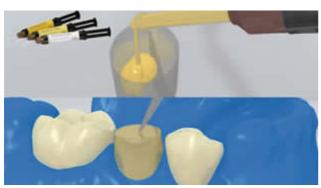

Next, **SpeedCEM Plus** is light-cured for 20 seconds. During this time, the post is held in place with the polymerization light. Materials that are opaque, in other words, impervious to light, should be allowed to self-cure.

## Core build-up

Clean dentin surfaces are etched and finally coated with a dentin bonding agent (e.g. **ExciTE F**, Syntac).

The core build-up material (e.g. **MultiCore Flow**) is filled in a core coping. Subsequently, a small amount of core build-up material is directly applied to the conditioned dentin. The core coping is placed on the prepared tooth

The core build-up material is cured according to the directions of the manufacturer.

## 8 Core build-up is prepared in accordance with a ferrule design

The core coping is removed and the the core build-up is prepared in accordance with a ferrule design.
